

DML SQL Statements

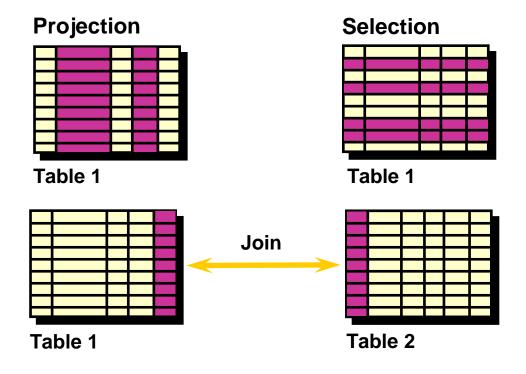

Database Design

Department of Computer Engineering
Sharif University of Technology

Maryam Ramezani <u>maryam.ramezani@sharif.edu</u>

Introduction

Introduction

```
CREATE TABLE AGENTS (
AGENT CODE CHAR (6) PRIMARY KEY,
AGENT NAME CHAR (40),
WORKING AREA CHAR (35),
COMMISSION NUMERIC (10, 2),
PHONE NO CHAR (15),
COUNTRY VARCHAR (25)
CREATE TABLE ORDERS (
ORD NUM SERIAL PRIMARY KEY,
ORD AMOUNT NUMERIC (12,2) NOT NULL,
ADVANCE AMOUNT NUMERIC (12,2) NOT NULL,
ORD DATE DATE NOT NULL,
CUST CODE VARCHAR (6) NOT NULL REFERENCES
CUSTOMER,
AGENT CODE CHAR (6) NOT NULL REFERENCES
AGENTS,
ORD DESCRIPTION VARCHAR (60) NOT NULL
);
```

```
CREATE TABLE CUSTOMER (
CUST CODE VARCHAR (6) PRIMARY KEY,
CUST NAME VARCHAR (40) NOT NULL,
CUST CITY CHAR (35),
WORKING AREA VARCHAR (35) NOT NULL,
CUST COUNTRY VARCHAR (20) NOT NULL,
GRADE INTEGER,
OPENING AMT NUMERIC (12,2) NOT NULL,
RECEIVE AMT NUMERIC (12,2) NOT NULL,
PAYMENT AMT NUMERIC (12,2) NOT NULL,
OUTSTANDING AMT NUMERIC (12,2) NOT NULL,
PHONE NO VARCHAR (17) NOT NULL,
AGENT CODE CHAR (6) NOT NULL REFERENCES
AGENTS
```

SELECT

Basic SELECT Statement

```
SELECT *|{[DISTINCT] column|expression [alias],...}
FROM table;
```

- SELECT identifies what columns
- FROM identifies which table

Selecting All Columns

SELECT *
FROM departments;

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
10	Administration	200	1700
20	Marketing	201	1800
50	Shipping	124	1500
60	IT	103	1400
80	Sales	149	2500
90	Executive	100	1700
110	Accounting	205	1700
190	Contracting		1700

Selecting Specific Columns

```
SELECT department_id, location_id FROM departments;
```

DEPARTMENT_ID	LOCATION_ID
10	1700
20	1800
50	1500
60	1400
80	2500
90	1700
110	1700
190	1700

Arithmetic Expressions

Create expressions with number and date data by using arithmetic operators.

Operator	Description
+	Add
-	Subtract
*	Multiply
1	Divide

Using Arithmetic Operators

```
SELECT last_name, salary, salary + 300
FROM employees;
```

LAST_NAME	SALARY	SALARY+300
King	24000	24300
Kochhar	17000	17300
De Haan	17000	17300
Hunold	9000	9300
Ernst	6000	6300

- - -

Hartstein	13000	13300
Fay	6000	6300
Higgins	12000	12300
Gietz	8300	8600

Operator Precedence & Using Parentheses

```
SELECT last name, salary, 12*(salary+100)
       employees;
FROM
```

SELECT	last_name,	salary,	12*salary+100

LAST_NAME	SALARY	12*SALARY+100
King	24000	288100
Kochhar	17000	204100
De Haan	17000	204100
Hunold	9000	108100
Ernst	6000	72100

LAST_NAME	SALARY	12*(SALARY+100)
King	24000	289200
Kochhar	17000	205200
De Haan	17000	205200
Hunold	9000	109200
Ernst	6000	73200

_	 _	_

Hartstein	13000	157200
Fay	6000	73200
Higgins	12000	145200
Gietz	8300	100800

20 rows selected

20 rows selected.

Hartstein	13000	156100
Fay	6000	72100
Higgins	12000	144100
Gietz	8300	99700
CE384: Databas	se Design	Maryam

Maryam Ramezani

Defining a Null Value

- A null is a value that is unavailable, unassigned, unknown, or inapplicable.
- A null is not the same as zero or a blank space.
- Arithmetic expressions containing a null value evaluate to null.

SELECT last_name, 12*salary*commission_pct FROM employees;

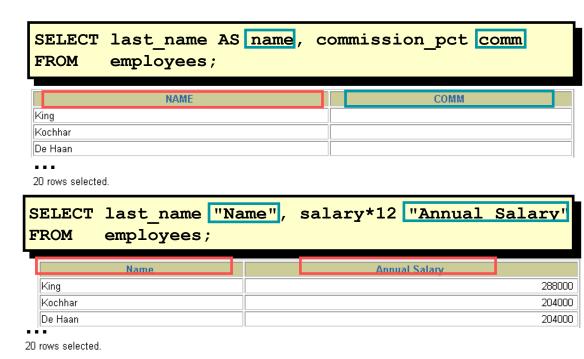

LAST_NAME	JOB_ID	SALARY	COMMISSION_PCT
King	AD_PRES	24000	
Kochhar	AD_VP	17000	
Zlotkey	SA_MAN	10500	.2
Abel	SA_REP	11000	.3
Taylor	SA_REP	8600	.2
Gietz	AC_ACCOUNT	8300	

Using Column Aliases

A column alias:

- Renames a column heading
- Is useful with calculations
- Immediately follows the column name there can also be the optional AS keyword between the column name and alias
- Requires double quotation marks if it contains spaces or special characters or is case sensitive

CE384: Database Design Maryam Ramezani 12

Concatenation Operator

- A concatenation operator:
- Concatenates columns or character strings to other columns
- Is represented by two vertical bars (||)
- Creates a resultant column that is a character expression

```
SELECT last_name||job_id AS "Employees"
FROM employees;
```

Emplo	yees
KingAD_PRES	
KochharAD_VP	
De HaanAD_VP	
HunoldIT_PROG	
ErnstIT_PROG	
LorentzIT_PROG	
MourgosST_MAN	
RajsST_CLERK	

Literal Character Strings

- A literal is a character, a number, or a date included in the SELECT list.
- Date and character literal values must be enclosed within single quotation marks.
- Each character string is output once for each

row returned.

```
SELECT last_name || | ' is a '|| job_id
AS "Employee Details"
FROM employees;
```

Employee Details			

Duplicate Rows

The default display of queries is all rows, including duplicate rows.

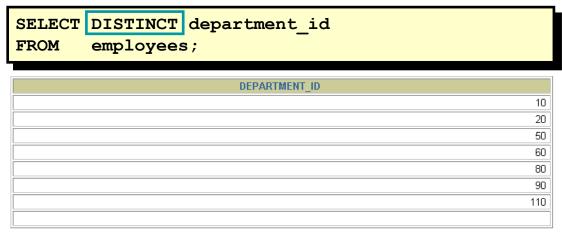

```
SELECT department_id
FROM employees;
```

DEPARTMENT_ID	
	90
	90
	90
	60
	60
	60
	50
	50
	50

Eliminating Duplicate Rows

■ Eliminate duplicate rows by using the DISTINCT keyword in the SELECT clause.

Restricting and Sorting

Limiting Rows Using a Selection

EMPLOYEES

EMPLOYEE_ID	LAST_NAME	JOB_ID	DEPARTMENT_ID
100	King	AD_PRES	90
101	Kochhar	AD_VP	90
102	De Haan	AD_VP	90
103	Hunold	IT_PROG	60
104	Ernst	IT_PROG	60
107	Lorentz	IT_PROG	60
124	Mourgos	ST_MAN	50

. . .

20 rows selected.

"retrieve all employees in department 90"

EMPLOYEE_ID	LAST_NAME	JOB_ID	DEPARTMENT_ID
100	King	AD_PRES	90
101	Kochhar	AD_VP	90
102	De Haan	AD_VP	90

Limiting the Rows Selected

■ Restrict the rows returned by using the WHERE clause.

■ The WHERE clause follows the FROM clause.

```
SELECT *|{[DISTINCT] column|expression [alias],...

FROM table
[WHERE condition(s)];
```

Using the WHERE Clause

With fixed value

```
SELECT employee_id, last_name, job_id, department_id
FROM employees
WHERE department_id = 90;
```

EMPLOYEE_ID	LAST_NAME	JOB_ID	DEPARTMENT_ID
100	King	AD_PRES	90
101	Kochhar	AD_VP	90
102	De Haan	AD_VP	90

☐ With variable

```
SELECT employee_id, last_name, job_id, department_id
FROM employees
WHERE department_id = :input;
```

Character Strings and Dates

- Character strings and date values are enclosed in single quotation marks.
- Character values are case sensitive, and date values are format sensitive.
- The default date format is DD-MON-RR.

```
SELECT last_name, job_id, department_id
FROM employees
WHERE last_name = 'Whalen';
```

Comparison Conditions

Operator	Meaning
=	Equal to
>	Greater than
>=	Greater than or equal to
<	Less than
<=	Less than or equal to
\Leftrightarrow	Not equal to

Operator	Meaning
BETWEEN AND	Between two values (inclusive),
IN(set)	Match any of a list of values
LIKE	Match a character pattern
IS NULL	Is a null value

Using Comparison Conditions

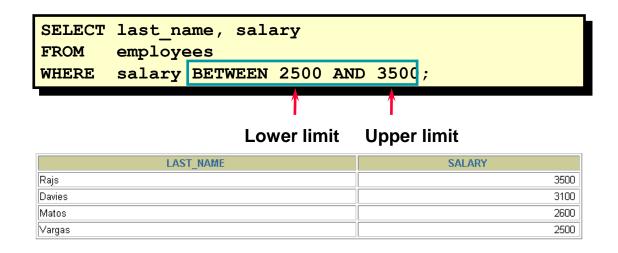

```
SELECT last_name, salary
FROM employees
WHERE salary <= 3000;
```

LAST_NAME	SALARY	
Matos	2600	
Vargas	2500	

Using the BETWEEN Condition

☐ Use the BETWEEN condition to display rows based on a range of values.

Using the IN Condition

■ Use the IN membership condition to test for values in a list.

```
SELECT employee_id, last_name, salary, manager_id FROM employees
WHERE manager_id IN (100, 101, 201);
```

EMPLOYEE_ID	LAST_NAME	SALARY	MANAGER_ID
202	Fay	6000	201
200	Whalen	4400	101
205	Higgins	12000	101
101	Kochhar	17000	100
102	De Haan	17000	100
124	Mourgos	5800	100
149	Zlotkey	10500	100
201	Hartstein	13000	100

Using the LIKE Condition

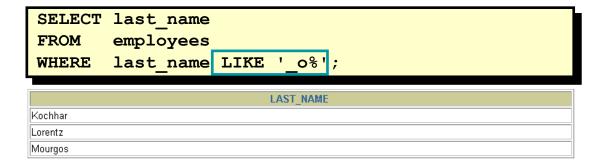

- Use the LIKE condition to perform wildcard searches of valid search string values.
- Search conditions can contain either literal characters or numbers:
 - % denotes zero or many characters.
 - denotes one character.

```
SELECT first_name
FROM employees
WHERE first_name LIKE 'S%';
```

Using the LIKE Condition

■ You can combine pattern-matching characters.

☐ You can use the ESCAPE identifier to search for the actual % and _ symbols.

Using the NULL Conditions

■ Test for nulls with the IS NULL operator.

```
SELECT last_name, manager_id
FROM employees
WHERE manager_id IS NULL;

LAST_NAME MANAGER_ID
King
```

Logical Conditions

Operator	Meaning
AND	Returns TRUE if both component conditions are true
OR	Returns TRUE if either component condition is true
NOT	Returns TRUE if the following condition is false

Using the AND Operator

☐ AND requires both conditions to be true.

```
SELECT employee_id, last_name, job_id, salary
FROM employees
WHERE salary >=10000
AND job_id LIKE '%MAN%';
```

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
149	Zlotkey	SA_MAN	10500
201	Hartstein	MK_MAN	13000

Using the OR Operator

OR requires either condition to be true.

```
SELECT employee_id, last_name, job_id, salary
FROM employees
WHERE salary >= 10000
OR job_id LIKE '%MAN%';
```

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
100	King	AD_PRES	24000
101	Kochhar	AD_VP	17000
102	De Haan	AD_VP	17000
124	Mourgos	ST_MAN	5800
149	Zlotkey	SA_MAN	10500
174	Abel	SA_REP	11000
201	Hartstein	MK_MAN	13000
205	Higgins	AC_MGR	12000

Using the NOT Operator

```
SELECT last_name, job_id

FROM employees

WHERE job_id

NOT IN ('IT_PROG', 'ST_CLERK', 'SA_REP');
```

LAST_NAME	JOB_ID
King	AD_PRES
Kochhar	AD_VP
De Haan	AD_VP
Mourgos	ST_MAN
Zlotkey	SA_MAN
Whalen	AD_ASST
Hartstein	MK_MAN
Fay	MK_REP
Higgins	AC_MGR
Gietz	AC_ACCOUNT

Rules of Precedence

Order Evaluated	Operator	
1	Arithmetic operators	
2	Concatenation operator	
3	Comparison conditions	
4	IS [NOT] NULL, LIKE, [NOT] IN	
5	[NOT] BETWEEN	
6	NOT logical condition	
7	AND logical condition	
8	OR logical condition	

Override rules of precedence by using parentheses.

Rules of Precedence

```
SELECT last_name, job_id, salary

FROM employees

WHERE job_id = 'SA_REP'

OR job_id = 'AD_PRES'

AND salary > 15000;
```

LAST_NAME	JOB_ID	SALARY
King	AD_PRES	24000
Abel	SA_REP	11000
Taylor	SA_REP	8600
Grant	SA_REP	7000

Rules of Precedence

■ Use parentheses to force priority.

King

LAST NAME

```
SELECT last_name, job_id, salary
FROM employees
WHERE (job_id = 'SA_REP'
OR job_id = 'AD_PRES')
AND salary > 15000;
```

AD PRES

JOB ID

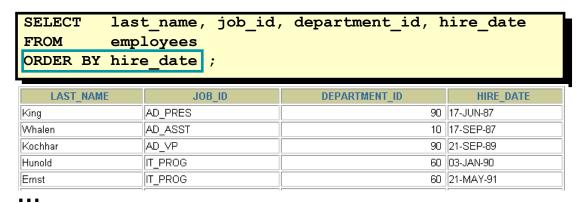

SALARY

24000

ORDER BY Clause

- Sort rows with the ORDER BY clause
 - ASC: ascending order, default
 - DESC: descending order
- The ORDER BY clause comes last in the SELECT statement.

Sorting in Descending Order

```
SELECT last_name, job_id, department_id, hire_date
FROM employees
ORDER BY hire_date DESC ;
```

LAST_NAME	JOB_ID	DEPARTMENT_ID	HIRE_DATE
Zlotkey	SA_MAN	80	29-JAN-00
Mourgos	ST_MAN	50	16-NOV-99
Grant	SA_REP		24-MAY-99
Lorentz	IT_PROG	60	07-FEB-99
Vargas	ST_CLERK	50	09-JUL-98
Taylor	SA_REP	80	24-MAR-98
Matos	ST_CLERK	50	15-MAR-98
Fay	MK_REP	20	17-AUG-97
Davies	ST_CLERK	50	29-JAN-97

- - -

20 rows selected.

Sorting by Column Alias

```
SELECT employee_id, last_name, salary*12 annsal FROM employees
ORDER BY annsal;
```

EMPLOYEE_ID	LAST_NAME	ANNSAL
144	Vargas	30000
143	Matos	31200
142	Davies	37200
141	Rajs	42000
107	Lorentz	50400
200	Whalen	52800
124	Mourgos	69600
104	Ernst	72000
202	Fay	72000
178	Grant	84000

. . .

20 rows selected.

Sorting by Multiple Columns

■ The order of ORDER BY list is the order of sort.

```
SELECT last_name, department_id, salary
FROM employees
ORDER BY department_id, salary DESC;
```

LAST_NAME	DEPARTMENT_ID	SALARY
Whalen	10	4400
Hartstein	20	13000
Fay	20	6000
Mourgos	50	5800
Rajs	50	3500
Davies	50	3100
Matos	50	2600
Vargas	50	2500

. . .

20 rows selected.

☐ You can sort by a column that is not in the SELECT list.

Summary

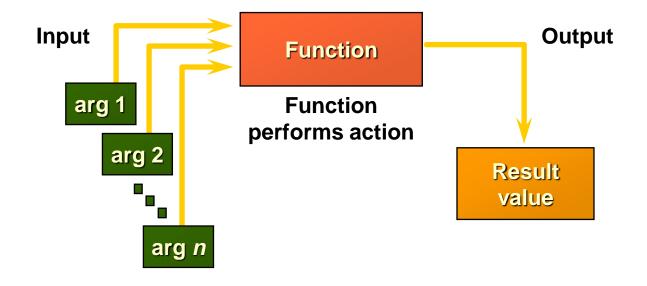

- In this lesson, you should have learned how to:
- ☐ Use the WHERE clause to restrict rows of output
 - Use the comparison conditions
 - Use the BETWEEN, IN, LIKE, and NULL conditions
 - Apply the logical AND, OR, and NOT operators
- ☐ Use the ORDER BY clause to sort rows of output

```
SELECT *|{[DISTINCT] column|expression [alias],...}
FROM table
[WHERE condition(s)]
[ORDER BY {column, expr, alias} [ASC|DESC]];
```

Single-Row Functions

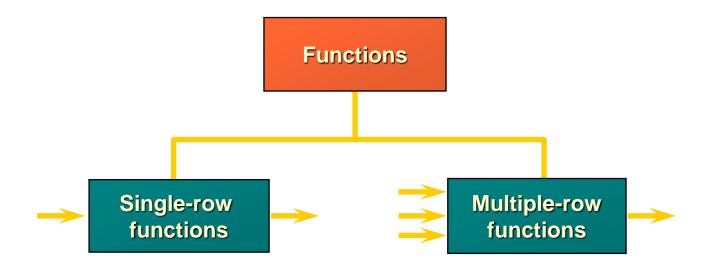

SQL Functions

Two Types of SQL Functions

Single-Row Functions

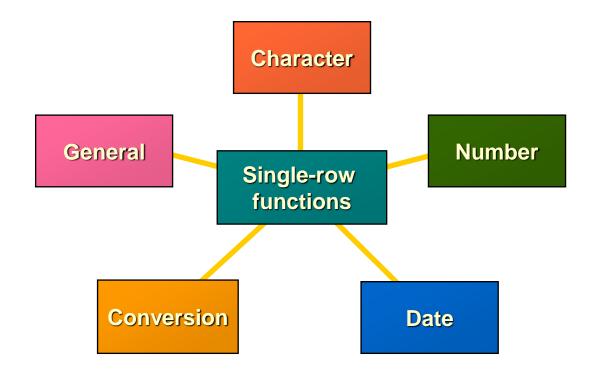

- Single row functions:
- Manipulate data items
- Accept arguments and return one value
- Act on each row returned
- Return one result per row
- May modify the data type
- Can be nested
- Accept arguments which can be a column or an expression

function_name [(arg1, arg2,...)]

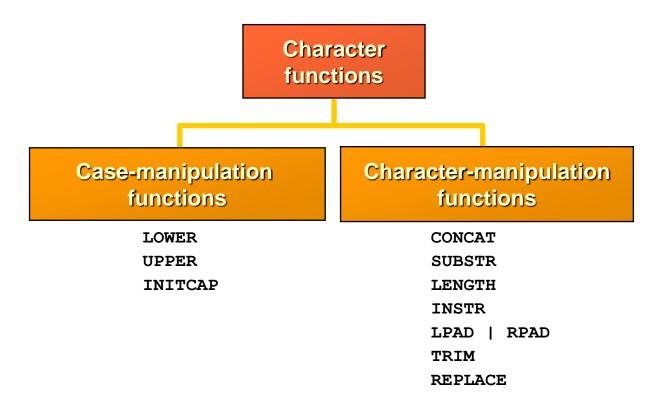

Single-Row Functions

Character Functions

Case Manipulation Functions

■ These functions convert case for character strings.

Function	Result
LOWER('SQL Course')	sql course
UPPER('SQL Course')	SQL COURSE
<pre>INITCAP('SQL Course')</pre>	Sql Course

Using Case Manipulation Functions

Display the employee number, name, and department number for employee Higgins:

```
SELECT employee id, last name, department id
FROM
       employees
WHERE last name = 'higgins';
no rows selected
       employee id, last name, department id
SELECT
FROM
       employees
       LOWER(last name) = 'higgins';
WHERE
     EMPLOYEE ID
                       LAST NAME
                                         DEPARTMENT ID
                205 Higgins
                                                       110
```

Character-Manipulation Functions

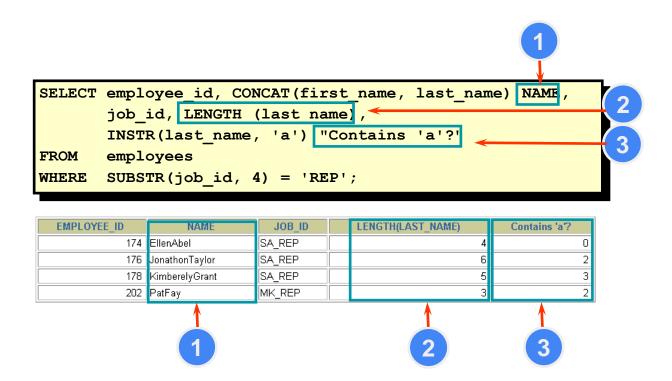

■ These functions manipulate character strings:

Function	Result
CONCAT('Hello', 'World')	HelloWorld
SUBSTR('HelloWorld',1,5)	Hello
LENGTH('HelloWorld')	10
<pre>INSTR('HelloWorld', 'W')</pre>	6
LPAD(salary,10,'*')	****24000
RPAD(salary, 10, '*')	24000****
TRIM('H' FROM 'HelloWorld')	elloWorld

Using the Character-Manipulation Functions

Number Functions

ROUND: Rounds value to specified decimal

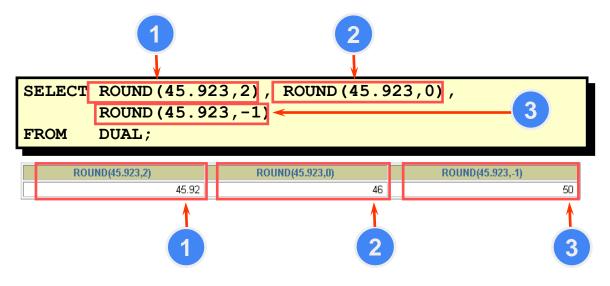

ROUND
$$(45.926, 2) \longrightarrow 45.93$$

TRUNC: Truncates value to specified decimal

MOD: Returns remainder of division

Using the ROUND Function

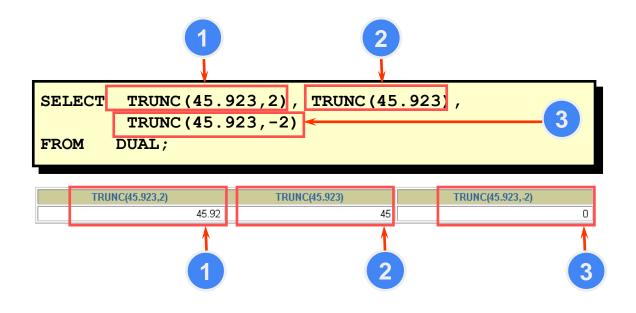

DUAL is a dummy table you can use to view results from functions and calculations. Postgres does not need it!!

Using the TRUNC Function

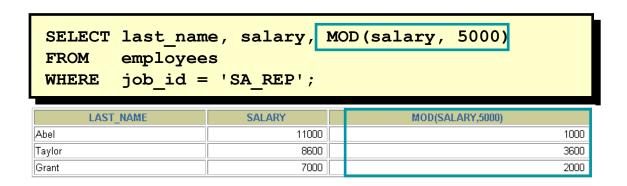

Using the MOD Function

■ Calculate the remainder of a salary after it is divided by 5000 for all employees whose job title is sales representative.

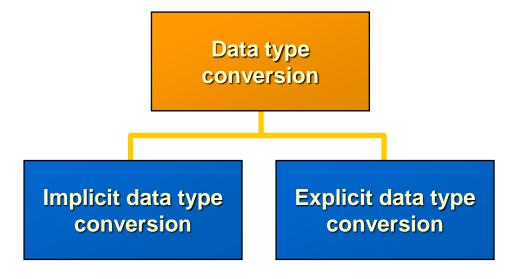

Working with Dates

Function	Description
MONTHS_BETWEEN	Number of months between two dates
ADD_MONTHS	Add calendar months to date
NEXT_DAY	Next day of the date specified
LAST_DAY	Last day of the month
ROUND	Round date
TRUNC	Truncate date

Conversion Functions

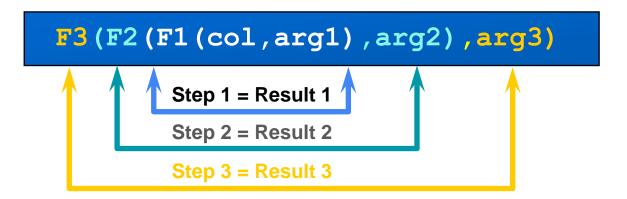

Nesting Functions

- □ Single-row functions can be nested to any level.
- Nested functions are evaluated from deepest level to the least deep level.

Nesting Functions

```
SELECT last_name,

coalesce (null,null,'No Manager')

FROM employees

WHERE manager_id IS NULL;
```

LAST_NAME	NVL(TO_CHAR(MANAGER_ID),'NOMANAGER')
King	No Manager

Using the CASE Expression

☐ Facilitates conditional inquiries by doing the work of an IF-THEN-ELSE statement:

```
SELECT last_name, job_id, salary,

CASE job_id WHEN 'IT_PROG' THEN 1.10*salary

WHEN 'ST_CLERK' THEN 1.15*salary

WHEN 'SA_REP' THEN 1.20*salary

ELSE salary END "REVISED_SALARY"

FROM employees;
```

LAST_NAME	JOB_ID	SALARY	REVISED_SALARY
	, [
Lorentz	IT_PROG	4200	4620
Mourgos	ST_MAN	5800	5800
Rajs	ST_CLERK	3500	4025
•••			
Gietz	AC_ACCOUNT	8300	8300
20 manus and and all			

20 rows selected.

Displaying Data from Multiple Tables

Nesting Functions

- Single-row functions can be nested to any level.
- Nested functions are evaluated from deepest level to the least deep level.

Displaying Data from Multiple Tables

Obtaining Data from Multiple Tables

EMPLOYEES

EMPLOYEE_ID	LAST_NAME	DEPARTMENT_ID
100	King	90
101	Kochhar	90
202	Fay	20
205	Higgins	110
206	Gietz	110

DEPARTMENTS

DEPARTMENT_ID	DEPARTMENT_NAME	LOCATION_ID
10	Administration	1700
20	Marketing	1800
50	Shipping	1500
60	IT	1400
80	Sales	2500
90	Executive	1700
110	Accounting	1700
190	Contracting	1700

	_	DEPARTMENT_NAME
200	10	Administration
201	20	Marketing
202	20	Marketing

102	90	Executive
205	110	Accounting
206	110	Accounting

Cartesian Products

- A join combines two or more tables side by side. If you do not specify how to join the tables, you get a Cartesian product. This means that SQL combines each row from the first table with every row from the second table.
- A Cartesian product is formed when:
 - A join condition is omitted
 - A join condition is invalid
 - All rows in the first table are joined to all rows in the second table
- To avoid a Cartesian product, always include a valid join condition in a WHERE clause.

Generating a Cartesian Product

☐ SELECT A.*, B.* FROM FRUITS A, SIZES B

_				_	
	100		п	•	
_		u			•
		•		•	-

Apples

Mangoes

Sizes
Small
Medium
Big

Cartesian Product And Resultant Data

Fruits	Sizes	
Apples	Small	
Mangoes	Small	
Apples	Medium	
Mangoes	Medium	
Apples	Big	
Mangoes	Big	

Generating a Cartesian Product

EMPLOYEES (20 rows)

EMPLOYEE_ID	LAST_NAME	DEPARTMENT_ID
100	King	90
101	Kochhar	90
202	Fay	20
205	Higgins	110
206	Gietz	110

20 rows selected.

DEPARTMENTS (8 rows)

DEPARTMENT_ID	DEPARTMENT_NAME	LOCATION_ID
10	Administration	1700
20	Marketing	1800
50	Shipping	1500
60	IT	1400
80	Sales	2500
90	Executive	1700
110	Accounting	1700
190	Contracting	1700

8 rows selected.

Cartesian product: 20x8=160 rows

EMPLOYEE_ID	DEPARTMENT_ID	LOCATION_ID
100	90	1700
101	90	1700
102	90	1700
103	60	1700
104	60	1700
107	60	1700

160 rows selected.

Join

■ SELECT A.fruitName, B.sizeName FROM FRUITS A, SIZES B WHERE A.FRUITID = B.FRUITID;

Results Messages

	fruitName 🗸	sizeName	~
1	Apples	Small	
2	Apples	Big	
3	Mangoes	Medium	

If we apply the join condition, we will get the output accordingly as given here. In this way, we can avoid Cartesian product and can get the values according to our requirements.

Joining Tables

Use a join to query data from more than one table.

```
SELECT table1.column, table2.column

FROM table1, table2

WHERE table1.column1 = table2.column2;
```

- Write the join condition in the WHERE clause.
- Prefix the column name with the table name when the same column name appears in more than one table.

What is an Equijoin?

An equijoin is a join based on equality or matching column values. This equality is indicated with an equal sign (=) as the comparison operator in the WHERE clause, as the following query shows.

EMPLOYEES

EMPLOYEE_ID	DEPARTMENT_ID
200	10
201	20
202	20
124	50
141	50
142	50
143	50
144	50
103	60
104	60
107	60

Matos	50	50	Shipping
Vargas	50	50	Shipping
Hunold	60	60	IT
Ernst	60	60	IT

Qualifying Ambiguous Column Names

- Use table prefixes to qualify column names that are in multiple tables.
- Improve performance by using table prefixes.
- Distinguish columns that have identical names but reside in different tables by using column aliases.

Using Table Aliases

- Simplify queries by using table aliases.
- Improve performance by using table prefixes.

Joining More than Two Tables

■ To join *n* tables together, you need a minimum of n-1 join conditions. For example, to join three tables, a minimum of two joins is required.

EMPLOYEES		DEPARTMENTS		LOCATIONS		
LAST_NAME	DEPARTMENT_ID		DEPARTMENT_ID	LOCATION_ID	LOCATION_ID	CITY

Lorentz	4200
Mourgos	5800
Rajs	3500
Davies	3100
Matos	2600
Vargas	2500
Zlotkey	10500
Abel	11000
Taylor	8600

20 rows selected

JOB GRADES

GRA	LOWEST_SAL	HIGHEST_SAL
А	1000	2999
В	3000	5999
С	6000	9999
D	10000	14999
E	15000	24999
F	25000	40000

Salary in the EMPLOYEES table must be between lowest salary and highest salary in the JOB_GRADES table.

Retrieving Records with Non-Equijoins

```
SELECT e.last_name, e.salary, j.grade_level
FROM employees e, job_grades j
WHERE e.salary
BETWEEN j.lowest_sal AND j.highest_sal;
```

LAST_NAME	SALARY	GRA
Matos	2600	А
Vargas	2500	А
Lorentz	4200	В
Mourgos	5800	В
Rajs	3500	В
Davies	3100	В
Whalen	4400	В
Hunold	9000	С
Ernst	6000	С

Self Joins

EMPLOYEES (WORKER)

EMPLOYEE_ID	LAST_NAME	MANAGER_ID
100	King	
101	Kochhar	100
102	De Haan	100
103	Hunold	102
104	Ernst	103
107	Lorentz	103

EMPLOYEES (MANAGER)

EMPLOYEE_ID	LAST_NAME
100	King
101	Kochhar
102	De Haan
103	Hunold
104	Ernst
107	Lorentz
124	Mourgos

MANAGER_ID in the WORKER table is equal to EMPLOYEE ID in the MANAGER table.

Joining a Table to Itself

	WORKER.LAST_NAME WORKSFOR' MANAGER.LAST_NAME
Kochhar works for King	
De Haan works for King	
Mourgos works for King	
Zlotkey works for King	
Hartstein works for King	
Whalen works for Kochhar	
Higgins works for Kochhar	
Hunold works for De Haan	
Ernst works for Hunold	

• • •

Creating Cross Joins

- ☐ The CROSS JOIN clause produces the cross-product of two tables.
- ☐ This is the same as a Cartesian product between the two tables.

```
SELECT last_name, department_name
FROM employees
CROSS JOIN departments ;
```

LAST_NAME	DEPARTMENT_NAME
King	Administration
Kochhar	Administration
De Haan	Administration
Hunold	Administration

Creating Natural Joins

- The NATURAL JOIN clause is based on all columns in the two tables that have the same name.
- It selects rows from the two tables that have equal values in all matched columns.
- ☐ If the columns having the same names have different data types, an error is returned.

Retrieving Records with Natural Joins

DEPARTMENT_ID	DEPARTMENT_NAME	LOCATION_ID	CITY
60	IT	1400	Southlake
50	Shipping	1500	South San Francisco
10	Administration	1700	Seattle
90	Executive	1700	Seattle
110	Accounting	1700	Seattle
190	Contracting	1700	Seattle
20	Marketing	1800	Toronto
80	Sales	2500	Oxford

Creating Joins with the USING Clause

- If several columns have the same names but the data types do not match, the NATURAL JOIN clause can be modified with the USING clause to specify the columns that should be used for an equijoin.
- Use the USING clause to match only one column when more than one column matches.
- Do not use a table name or alias in the referenced columns.
- The NATURAL JOIN and USING clauses are mutually exclusive.

Retrieving Records with the USING Clause

```
SELECT e.employee_id, e.last_name, d.location_id
FROM employees e JOIN departments d
USING (department id) ;
```

EMPLOYEE_ID	LAST_NAME	LOCATION_ID
200	Whalen	1700
201	Hartstein	1800
202	Fay	1800
124	Mourgos	1500
141	Rajs	1500
142	Davies	1500
143	Matos	1500
144	Vargas	1500
103	Hunold	1400

Creating Joins with the ON Clause

- ☐ The join condition for the natural join is basically an equijoin of all columns with the same name.
- To specify arbitrary conditions or specify columns to join, the ON clause is used.
- The join condition is separated from other search conditions.
- The ON clause makes code easy to understand.

Retrieving Records with the ON Clause

EMPLOYEE_ID	LAST_NAME	DEPARTMENT_ID	DEPARTMENT_ID	LOCATION_ID
200	Whalen	10	10	1700
201	Hartstein	20	20	1800
202	Fay	20	20	1800
124	Mourgos	50	50	1500
141	Rajs	50	50	1500
142	Davies	50	50	1500
143	Matos	50	50	1500

- - -

Creating Three-Way Joins with the ON Clause

```
SELECT employee_id, city, department_name
FROM employees e

JOIN departments d
ON d.department_id = e.department_id
JOIN locations l
ON d.location id = l.location id;
```

EMPLOYEE_ID	CITY	DEPARTMENT_NAME
103	Southlake	IT
104	Southlake	IT
107	Southlake	IT
124	South San Francisco	Shipping
141	South San Francisco	Shipping
142	South San Francisco	Shipping
143	South San Francisco	Shipping
144	South San Francisco	Shipping

. . .

Outer Joins

DEPARTMENTS

DEPARTMENT_NAME	DEPARTMENT_ID

Contracting	190

8 rows selected.

EMPLOYEES

DEPARTMENT_ID	LAST_NAME
90	King
90	Kochhar
90	De Haan
60	Hunold
60	Ernst
60	Lorentz
50	Mourgos
50	Rajs
50	Davies
50	Matos
50	Vargas
80	Zlotkey

20 rows selected.

There are no employees in department 190.

Outer Joins Syntax

- You use an outer join to also see rows that do not meet the join condition.
- The left and right joint are the syntax.

```
SELECT table1.column, table2.column

FROM table1 left join table2
on table1.column = table2.column;
```

```
SELECT table1.column, table2.column

FROM table1 right join table2

on table1.column table2.column;
```

LEFT OUTER JOIN

```
SELECT e.last_name, e.department_id, d.department_name
FROM employees e
LEFT OUTER JOIN departments d
ON (e.department_id = d.department_id);
```

LAST_NAME	DEPARTMENT_ID	DEPARTMENT_NAME	
Whalen	10	Administration	
Fay	20	Marketing	
Hartstein	20	Marketing	
• • •			
De Haan	90	Executive	
Kochhar	90	Executive	
King	90	Executive	
Gietz	110	Accounting	
Higgins	110	Accounting	
Grant			

RIGHT OUTER JOIN

```
SELECT e.last_name, e.department_id, d.department_name
FROM employees e
RIGHT OUTER JOIN departments d
ON (e.department_id = d.department_id);
```

LAST_NAME	DEPARTMENT_ID	DEPARTMENT_NAME
King	90	Executive
Kochhar	90	Executive
Whalen	10	Administration
Hartstein	20	Marketing
Fay	20	Marketing
Higgins	110	Accounting
Gietz	110	Accounting
		Contracting

INNER Versus OUTER Joins

- In SQL: 1999, the join of two tables returning only matched rows is an inner join.
- A join between two tables that returns the results of the inner join as well as unmatched rows left (or right) tables is a left (or right) outer join.
- A join between two tables that returns the results of an inner join as well as the results of a left and right join is a full <u>outer</u> join.

FULL OUTER JOIN

```
SELECT e.last_name, e.department_id, d.department_name
FROM employees e
FULL OUTER JOIN departments d
ON (e.department_id = d.department_id);
```

LAST_NAME	DEPARTMENT_ID	DEPARTMENT_NAME
Whalen	10	Administration
Fay	20	Marketing
De Haan	90	Executive
Kochhar	90	Executive
King	90	Executive
Gietz	110	Accounting
Higgins	110	Accounting
Grant		
		Contracting

Additional Conditions

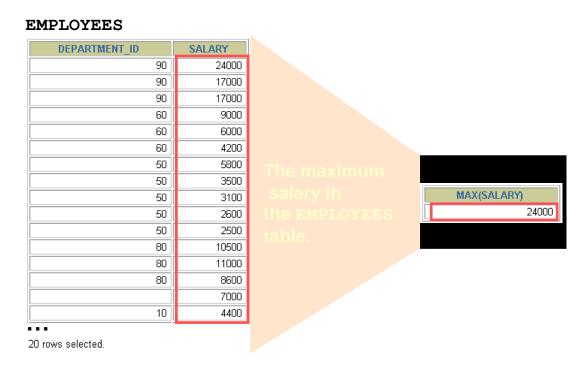

EMPLOYEE_ID	LAST_NAME	DEPARTMENT_ID	DEPARTMENT_ID	LOCATION_ID
174	Abel	80	80	2500
176	Taylor	80	80	2500

Aggregating Data Using Group Functions

What Are Group Functions?

Group functions operate on sets of rows to give one result per group.

Types of Group Functions (Aggregations)

- AVG
- ☐ COUNT
- ☐ MAX
- ☐ MIN
- ☐ STDDEV
- ☐ SUM
- VARIANCE

Group Functions Syntax

```
SELECT [column,] group function(column), ...

FROM table
[WHERE condition]
[GROUP BY column]
[ORDER BY column];
```

Using the AVG and SUM Functions

You can use AVG and SUM for numeric data.

```
SELECT AVG(salary), MAX(salary),
MIN(salary), SUM(salary)

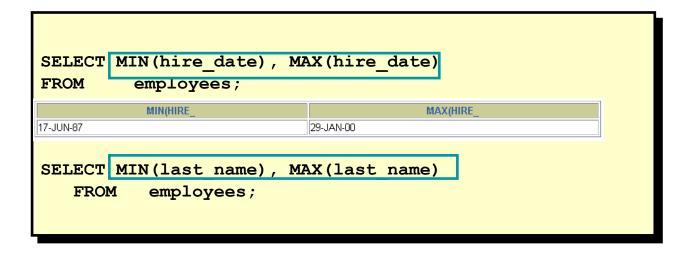

FROM employees
WHERE job_id LIKE '%REP%';
```

AVG(SALARY)	MAX(SALARY)	MIN(SALARY)	SUM(SALARY)
8150	11000	6000	32600

Using the MIN and MAX Functions

■ You can use MIN and MAX for any data type.

Using the COUNT Function

□ COUNT (*) returns the number of rows in a table.

```
SELECT COUNT(*)

FROM employees
WHERE department_id = 50;

COUNT(*)
```

Using the COUNT Function

- \square COUNT (expr) returns the number of rows with non-null values for the expr.
- Display the number of department values in the EMPLOYEES table, excluding the null values.

```
SELECT COUNT(commission_pct)
FROM employees
WHERE department_id = 80;
COUNT(COMMISSION_PCT)
```

Using the DISTINCT Keyword

- □ COUNT (DISTINCT expr) returns the number of distinct non-null values of the expr.
- ☐ Display the number of distinct department values in the EMPLOYEES table.

```
SELECT COUNT (DISTINCT department_id)
FROM employees;

COUNT(DISTINCTDEPARTMENT_ID)
7
```

Group Functions and Null Values

Group functions ignore null values in the column.

```
select avg(opening_amt) from customer
```

☐ The coalesce function forces group functions to include null values.

```
select avg(coalesce(opening_amt,0)) from customer
```

Creating Groups of Data

EMPLOYEES

	SALARY	DEPARTMENT_ID
4400	4400	10
9500	13000	20
9500	6000	20
a	5800	50
	3500	50
3500	3100	50
	2500	50

60	6400
80	10033.3333
90	19333.3333
110	10150
	7000

Creating Groups of Data: The GROUP BY Clause Syntax

☐ Divide rows in a table into smaller groups by using the GROUP BY clause.

```
SELECT column, group_function(column)

FROM table

[WHERE condition]

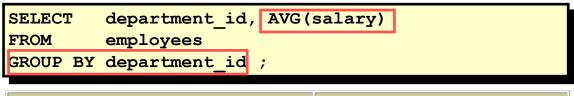

[GROUP BY group_by_expression]

[ORDER BY column];
```

Using the GROUP BY Clause

All columns in the SELECT list that are not in group functions must be in the GROUP BY clause.

DEPARTMENT_ID	AVG(SALARY)
10	4400
20	9500
50	3500
60	6400
80	10033.3333
90	19333.3333
110	10150
	7000

Using the GROUP BY Clause

☐ The GROUP BY column does not have to be in the SELECT list.

```
SELECT AVG(salary)
FROM employees
GROUP BY department_id;
```

AVG(SALARY)	
	4400
	9500
	3500
	6400
	10033.3333
	19333.3333
	10150
	7000

Grouping by More Than One Column

EMPLOYEES

110	AC_MGR	12000
110	AC_ACCOUNT	8300
20 rowe colocted		

"Add up the salaries in the EMPLOYEES table for each job, grouped by department.

DEPARTMENT_ID	JOB_ID	SUM(SALARY)
10	AD_ASST	4400
20	MK_MAN	13000
20	MK_REP	6000
50	ST_CLERK	11700
50	ST_MAN	5800
60	IT_PROG	19200
80	SA_MAN	10500
80	SA_REP	19600
90	AD_PRES	24000
90	AD_VP	34000
110	AC_ACCOUNT	8300
110	AC_MGR	12000
	SA_REP	7000

Using the GROUP BY Clause on Multiple Columns

```
SELECT department_id dept_id, job_id, SUM(salary)
FROM employees
GROUP BY department_id, job_id;
```

DEPT_ID	JOB_ID	SUM(SALARY)
10	AD_ASST	4400
20	MK_MAN	13000
20	MK_REP	6000
50	ST_CLERK	11700
50	ST_MAN	5800
60	IT_PROG	19200
80	SA_MAN	10500
80	SA_REP	19600
90	AD_PRES	24000
90	AD_VP	34000
110	AC_ACCOUNT	8300
110	AC_MGR	12000
	SA_REP	7000

13 rows selected.

Illegal Queries - Using Group Functions

Any column or expression in the SELECT list that is not an aggregate function must be in the GROUP BY clause.

■ Column missing in the GROUP BY clause:

```
SELECT department_id, COUNT(last_name)
FROM employees;
```

```
SELECT department_id, COUNT(last_name)

*

ERROR at line 1:

ORA-00937: not a single-group group function
```

Illegal Queries – Using Group Functions

- You cannot use the WHERE clause to restrict groups.
- You use the HAVING clause to restrict groups.
- You cannot use group functions in the WHERE clause.
- Cannot use the WHERE clause to restrict groups:

```
SELECT department_id, AVG(salary)

FROM employees

WHERE AVG(salary) > 8000

GROUP BY department_id;
```

```
WHERE AVG(salary) > 8000
     *
ERROR at line 3:
ORA-00934: group function is not allowed here
```

Excluding Group Results

EMPLOYEES

DEPARTMENT_ID	SALARY
90	24000
90	17000
90	17000
60	9000
60	6000
60	4200
50	5800
50	3500
50	3100
50	2600
50	2500
80	10500
80	11000
80	8600
•••	
20	6000
110	12000
110	8300
20 rows selected.	

The maximum salary per department when it is greater than \$10,000

DEPARTMENT_ID	MAX(SALARY)
20	13000
80	11000
90	24000
110	12000

Excluding Group Results: The HAVING Clause

Use the HAVING clause to restrict groups:

- 1. Rows are grouped.
- 2. The group function is applied.
- 3. Groups matching the HAVING clause are displayed.

```
SELECT column, group_function

FROM table

[WHERE condition]

[GROUP BY group by expression]

[HAVING group_condition]

[ORDER BY column];
```

Using the HAVING Clause

```
SELECT department_id, MAX(salary)
FROM employees
GROUP BY department_id
HAVING MAX(salary)>10000 ;
```

DEPARTMENT_ID	MAX(SALARY)
20	13000
80	11000
90	24000
110	12000

Using the HAVING Clause

```
SELECT job_id, SUM(salary) PAYROLL
FROM employees
WHERE job_id NOT LIKE '%REP%'
GROUP BY job_id
HAVING SUM(salary) > 13000
ORDER BY SUM(salary);
```

JOB_ID	PAYROLL
IT_PROG	19200
AD_PRES	24000
AD_VP	34000

Nesting Group Functions

Display the maximum average salary.

```
SELECT MAX(AVG(salary))
FROM employees
GROUP BY department_id;
```

MAX(AVG(SALARY))
19333.3333

Summary

You should have learned how to:

- ☐ Use the group functions COUNT, MAX, MIN, AVG
- Write queries that use the GROUP BY clause
- Write queries that use the HAVING clause

```
SELECT column, group_function(column)

FROM table

[WHERE condition]

[GROUP BY group_by_expression]

[HAVING group_condition]

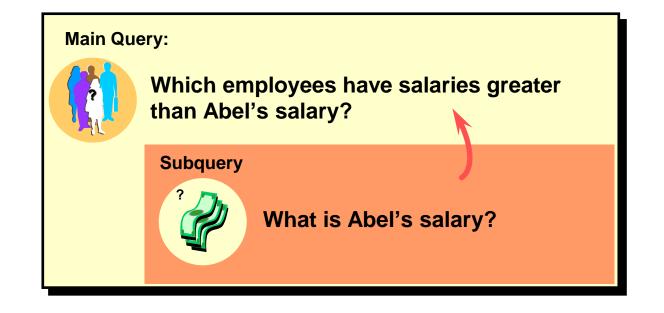

[ORDER BY column];
```

Subqueries

Using a Subquery to Solve a Problem

Who has a salary greater than Abel's?

Nested Queries - Definitions

- A nested query is a query inside another query
 - The enclosing query also called outer query
 - Nested query is called inner query
- It usually appears as a condition in where or having clauses.
- There can be multiple levels of nesting
- There are two kinds of nested queries
 - Correlated
 - Non-Correlated

Example:

Nested Queries: Non-Correlated

Generates data required by outer query before it can be executed Inner query does not contain any reference to outer query Behaves like a procedure The result should not contain any column from the nested query Example Schema: People (person fname, person lname, person id, person state, person city) Movies (movie id, movie title, director id, studio id) Query: Select movie title, studio id From Movies Where director id IN (Select person id From People Where person state = 'TX') Steps: Subquery is executed Subquery results are plugged into the outer query The outer query is processed

CE384: Database Design Maryam Ramezani

Nested Queries: Correlated

- Contains reference to the outer query
- Behaves like a loop

Example:

Steps:

- Contents of the table row in outer query are read
- Sub-query is executed using data in the row being processed.
- Results of the inner query are passed to the where in the outer query
- The Outer query is Processed
- Loop continues till all rows are exhausted

Subquery Syntax

- The subquery (inner query) executes once before the main query.
- The result of the subquery is used by the main query (outer query).

```
SELECT select_list
FROM table
WHERE expr operator
(SELECT select_list
FROM table);
```

Using a Subquery

```
LAST_NAME

King

Kochhar

De Haan

Hartstein

Higgins
```

Guidelines for Using Subqueries

- Enclose subqueries in parentheses.
- Place subqueries on the right side of the comparison condition.
- The ORDER BY clause in the subquery is not needed unless you are performing Top-N analysis.
- Use single-row operators with single-row subqueries and use multiple-row operators with multiple-row subqueries.

Types of Subqueries

126

- Types of Subqueries
 - Single-row subqueries: Queries that return only one row from the inner SELECT statement
 - Multiple-row subqueries: Queries that return more than one row from the inner SELECT statement
 - Note: There are also multiple-column subqueries: Queries that return more than one column from the inner SELECT statement.

Single-row subquery

Multiple-row subquery

CE384: Database Design Maryam Ramezani

Single-Row Subqueries

- ☐ Return only one row
- ☐ Use single-row comparison operators

Operator	Meaning
=	Equal to
>	Greater than
>=	Greater than or equal to
<	Less than
<=	Less than or equal to
<>	Not equal to

Executing Single-Row Subqueries

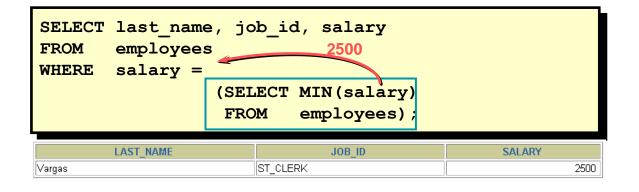

```
SELECT last name, job id, salary
FROM
       employees
                               ST CLERK
WHERE
       job id =
                 (SELECT job id
                         employees
                  FROM
                         employee id = 141)
                  WHERE
       salary >
AND
                 (SELECT
                         salary
                  FROM
                         employees
                         employee id = 143);
                  WHERE
```

LAST_NAME	JOB_ID	SALARY
Rajs	ST_CLERK	3500
Davies	ST_CLERK	3100

Using Group Functions in a Subquery

The HAVING Clause with Subqueries

- ☐ The Oracle server executes subqueries first.
- The Oracle server returns results into the HAVING clause of the main query.

```
SELECT department_id, MIN(salary)
FROM employees
GROUP BY department_id
HAVING MIN(salary) >

(SELECT MIN(salary)
FROM employees
WHERE department_id = 50);
```

What is Wrong with this Statement?

```
ERROR at line 4:
ORA-01427: single-row subquery returns more than
one row
```

Single-row operator with multiple-row subquery

Will this Statement Return Rows?

```
no rows selected
```

Subquery returns no values

Multiple-Row Subqueries

- ☐ Return more than one row
- Use multiple-row comparison operators

Operator	Meaning
IN	Equal to any member in the list
ANY	Compare value to each value returned by the subquery
ALL	Compare value to every value returned by the subquery

Using the ANY Operator in Multiple-Row Subqueries

```
SELECT employee_id, last_name, job_id, salary
FROM employees 9000,6000,4200
WHERE salary < ANY

(SELECT salary
FROM employees
WHERE job_id = 'IT_PROG')
AND job_id <> 'IT_PROG';
```

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
124	Mourgos	ST_MAN	5800
141	Rajs	ST_CLERK	3500
142	Davies	ST_CLERK	3100
143	Matos	ST_CLERK	2600
144	Vargas	ST_CLERK	2500

10 rows selected.

Using the ALL Operator in Multiple-Row Subqueries

```
SELECT employee_id, last_name, job_id, salary

FROM employees

WHERE salary < ALL

(SELECT salary

FROM employees

WHERE job_id = 'IT_PROG')

AND job_id <> 'IT_PROG';
```

EMPLOYEE_ID	LAST_NAME	JOB_ID	SALARY
141	Rajs	ST_CLERK	3500
142	Davies	ST_CLERK	3100
143	Matos	ST_CLERK	2600
144	Vargas	ST_CLERK	2500

Null Values in a Subquery

```
SELECT emp.last_name
FROM employees emp
WHERE emp.employee_id NOT IN

(SELECT mgr.manager_id
FROM employees mgr);

no rows selected
```

Any, Some, All

- ☐ The ALL keyword modifies the greater than comparison operator to mean greater than all values.
- The ANY keyword is not as restrictive as the ALL keyword.
- When used with the greater than comparison operator, "> ANY" means greater than some value.
- ☐ The "= ANY" operator is exactly equivalent to the IN operator.
- However, the "!= ANY" (not equal any) is not equivalent to the NOT IN operator.

Any, Some, All

☐ Give the providers whose status are not maximum.

1- SELECT S#

FROM S

WHERE STATUS < ANY (SELECT DISTINCT STATUS FROM S)

2- SELECT S#

FROM S

WHERE STATUS < (SELECT MAX (STATUS) FROM S)

Subqueries and the EXISTS Operator

- When a subquery uses the EXISTS operator, the subquery functions as an existence test.
- □ The WHERE clause of the outer query tests for the existence of rows returned by the inner query.
- □ The subquery does not actually produce any data; rather, it returns a value of TRUE or FALSE.
- The general format of a subquery WHERE clause with an EXISTS operator is shown here.
- Note that the NOT operator can also be used to negate the result of the EXISTS operator.

WHERE [NOT] EXISTS (subquery)

Example

```
SELECT emp_last_name "Last Name", emp_first_name "First Name"
FROM employee
WHERE EXISTS
    (SELECT *
    FROM dependent
    WHERE emp_ssn = dep_emp_ssn);
```

```
Last Name First Name

Joyner Suzanne

Zhu Waiman

Bock Douglas
```

Subqueries and the EXISTS operator

- Subqueries using an EXISTS operator are a bit different from other subqueries, in the following ways:
 - The keyword EXISTS is not preceded by a column name, constant, or other expression.
 - The SELECT clause list of a subquery that uses an EXISTS operator almost always consists of an asterisk (*). This is because there is no real point in listing column names since you are simply testing for the existence of rows that meet the conditions specified in the subquery.
 - The subquery evaluates to TRUE or FALSE rather than returning any data.
 - A subquery that uses an EXISTS operator will always be a correlated subquery.

Subqueries and the EXISTS operator

- The EXISTS operator is very important, because there is often no alternative to its use.
- □ All queries that use the IN operator or a modified comparison operator (=, <, >, etc. modified by ANY or ALL) can be expressed with the EXISTS operator.
- However, some queries formulated with EXISTS cannot be expressed in any other way!
- □ The NOT EXISTS operator is the mirror-image of the EXISTS operator.
- A query that uses NOT EXISTS in the WHERE clause is satisfied if the subquery returns no rows.

Subqueries and the EXISTS operator

```
SELECT
SELECT emp last name
                                             emp last name
FROM employee
WHERE emp ssn = ANY
                                         FROM employee
    (SELECT dep emp ssn
                                         WHERE EXISTS
     FROM dependent);
                                              (SELECT *
                                              FROM dependent
                                              WHERE emp ssn
                                              = dep emp ssn);
EMP LAST NAME
Bock
                                         EMP LAST NAME
Zhu
Joyner
                                         Bock
                                         Zhu
```

Joyner

Subqueries and the ORDER BY Clause

- ☐ The SELECT statement shown below adds the ORDER BY clause to specify sorting by first name within last name.
- Note that the ORDER BY clause is placed after the WHERE clause, and that this includes the subquery as part of the WHERE clause.

```
SELECT emp last name "Last Name",
 emp first name "First Name"
                                           Output:
FROM employee
WHERE EXISTS
                                           Last Name First Name
    (SELECT *
     FROM dependent
                                           Bock
                                                      Douglas
     WHERE emp ssn = dep emp ssn)
                                           Joyner
                                                      Suzanne
ORDER BY emp last name, emp first name;
                                           7.hii
                                                      Waiman
```

Union

 Union Joins allow multiple query results to be combined into a single result set

Syntax

```
Select select_list
From table [,table, ....]
[Where condition]
Union [All]
Select select_list
From table [,table, ....]
[Where condition]
```

Example

```
Select person_id,
person_city, person_state
From People
Union
Select studio_id,
studio_city,
studio_state
From Studios
```

Notes:

- The number of columns selected for both the queries should be the same
- The columns are merged in order in which they are selected
- The duplicates are eliminated from the combined table
- More than two tables can be joined together

Union (All & Order By)

- Union query eliminates all duplicates in the resultant table
 - All option is used when we do not want to eliminate the duplicates
- Union and Order By can be used together to order the results of the combined table
 - This clause is not allowed when a single column result is obtained and the all keyword is used since the duplicates are eliminated and there is nothing to order by

Example

```
Select studio_id, studio_state
From Studios
Union
Select Person_id, person_state
From People
Order By studio state
```

Intersect

In the Intersect Query results of two separate queries are concatenated, however, only common elements of the two queries are included in the resultset

Example

Select person_state
From People
Intersect
Select studio_state
From Studios

Subquery Benefits

- They can simplify the logic and readability of your query, especially if you need to filter or aggregate data before joining it with another table.
- They can help you avoid duplicate rows or columns that might result from a join operation.
- ☐ They can enable you to perform complex calculations or comparisons that might not be possible with a join.
 - For example, you can use a subquery to find the average salary of each department, and then compare it with the salary of each employee in the main query.

Subquery Drawbacks

the main query.

Subqueries also have some drawbacks that can affect database performance.
 They can increase the processing time and memory usage of your query, especially if the subquery returns a large number of rows or columns.
 They can limit the optimization options of the database system, as some subqueries cannot use indexes or other techniques to speed up the execution.
 They can introduce errors or inconsistencies if the subquery is not correlated with the main query, or if the subquery data changes during the execution of

Join Benefits

Joins are another way to query data from multiple tables in a database.

- ☐ They can reduce the number of queries and subqueries needed to retrieve the data you want, which can save processing time and memory.
- They can leverage the indexes and other features of the database system to optimize the join operation and make it faster and more efficient.
- ☐ They can ensure the consistency and accuracy of the data, as the join condition determines which rows from each table are matched and returned.

Join Drawbacks

- ☐ They can complicate the syntax and readability of your query, especially if you need to join multiple tables or use different types of joins.
- ☐ They can generate unwanted or redundant rows or columns that might affect the quality and size of the result set.
- They can require careful planning and design of the database schema and the join condition, as poorly structured or indexed tables or columns can slow down or fail the join operation.

How to choose

- Deciding whether to use a subquery or a join for your query is dependent on various factors, such as the data structure, the query complexity, the database system, and the performance goals.
- As a general guideline, you should use a subquery if you need to filter or aggregate data before joining it with another table, or if you need to perform calculations or comparisons that are not possible with a join. On the other hand, if you need to query data from multiple tables based on a common column or condition, or if you want to take advantage of the optimization features of the database system, then using a join is recommended.
- Ultimately, it is best to test and compare the execution time and result set of both options and choose the one that meets your requirements and expectations.

Manipulating Data

Adding a New Row to a Table

70 Public Relations

100 1700

New row

DEPARTMENTS

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
10	Administration	200	1700
20	Marketing	201	1800
50	Shipping	124	1500
60	IT	103	1400
80	Sales	149	2500
90	Executive	100	1700
110	Accounting	205	1700
190	Contracting		1700

...insert a new row into the DEPARMENTS table...

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
10	Administration	200	1700
20	Marketing	201	1800
50	Shipping	124	1500
60	IT	103	1400
80	Sales	149	2500
90	Executive	100	1700
110	Accounting	205	1700
190	Contracting		1700
70 Public Relations		100	1700

The INSERT Statement Syntax

■ Add new rows to a table by using the INSERT statement.

Only one row is inserted at a time with this syntax.

Inserting New Rows

- Insert a new row containing values for each column.
- ☐ List values in the default order of the columns in the table.
- Optionally, list the columns in the INSERT clause.

Enclose character and date values within single quotation marks.

Inserting Rows with Null Values

☐ Implicit method: Omit the column from the column list.

• Explicit method: Specify the NULL keyword in the VALUES clause.

```
INSERT INTO departments
VALUES (100, 'Finance', NULL, NULL);
1 row created.
```

Inserting Special Values

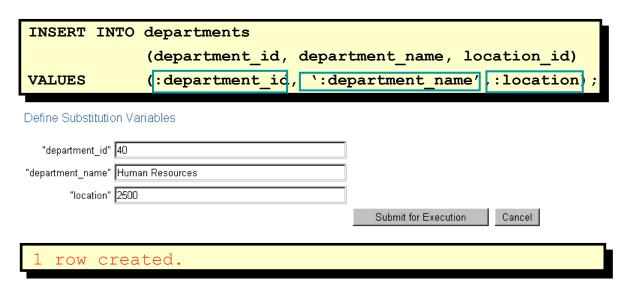

☐ The current_date function records the current date.

```
INSERT INTO employees (employee id,
                 first name, last name,
                 email, phone number,
                 hire date, job id, salary,
                 commission pct, manager id,
                 department id)
                     (113,
VALUES
                 'Louis', 'Popp',
                  'LPOPP', '515.124.4567',
                 current date 'AC ACCOUNT', 6900,
                 NULL, 205, 100);
  row created.
```

Creating a Script

- Use: substitution in a SQL statement to prompt for values.
- : is a placeholder for the variable value.

Copying Rows from Another Table

■ Write your INSERT statement with a subquery.

```
INSERT INTO sales_reps(id, name, salary, commission_pct)
   SELECT employee_id, last_name, salary, commission_pct
   FROM employees
   WHERE job_id LIKE '%REP%';

4 rows created.
```

- Do not use the VALUES clause.
- Match the number of columns in the INSERT clause to those in the subquery.

Changing Data in a Table

EMPLOYEES

EMPLOYEE_ID	FIRST_NAME	LAST_NAME	EMAIL	HIRE_DATE	JOB_ID	SALARY	DEPARTMENT_ID	COMMISSION_F
100	Steven	King	SKING	17-JUN-87	AD_PRES	24000	90	
101	Neena	Kochhar	NKOCHHAR	21-SEP-89	AD_VP	17000	90	
102	Lex	De Haan	LDEHAAN	13-JAN-93	AD_VP	17000	90	
103	Alexander	Hunold	AHUNOLD	03-JAN-90	IT_PROG	9000	60	
104	Bruce	Ernst	BERNST	21-MAY-91	IT_PROG	6000	60	
107	Diana	Lorentz	DLORENTZ	07-FEB-99	IT_PROG	4200	60	
124	Kevin	Mourgos	KMOURGOS	16-NOV-99	ST_MAN	5800	50	

Update rows in the EMPLOYEES table.

The UPDATE Statement Syntax

■ Modify existing rows with the UPDATE statement.

```
UPDATE table

SET column = value [, column = value, ...]

[WHERE condition];
```

Update more than one row at a time, if required.

Updating Rows in a Table

■ Specific row or rows are modified if you specify the WHERE clause.

```
UPDATE employees
SET department id = 70
WHERE employee_id = 113;
1 row updated.
```

■ All rows in the table are modified if you omit the WHERE clause.

```
UPDATE copy_emp
SET department_id = 110;
22 rows updated.
```

Updating Two Columns with a Subquery

□ Update employee 114's job and salary to match that of employee 205.

```
UPDATE
         employees
         job id
                   (SELECT
                            job id
SET
                    FROM
                            employees
                    WHERE
                            employee id = 205
         salary
                   (SELECT
                            salary
                    FROM
                            employees
                    WHERE
                            employee id = 205
        employee id
                           114;
1 row updated.
```

Updating Rows Based on Another Table

Use subqueries in UPDATE statements to update rows in a table based on values from another table.

Updating Rows: Integrity Constraint Error

Department number 55 does not exist in the parent table!

```
UPDATE employees
SET    department_id = 55
WHERE department_id = 110;
```

```
UPDATE employees

*
ERROR at line 1:
ORA-02291: integrity constraint (HR.EMP_DEPT_FK)
violated - parent key not found
```

Removing a Row from a Table

DEPARTMENTS

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
10	Administration	200	1700
20	Marketing	201	1800
30	Purchasing		
100	Finance		
50	Shipping	124	1500
60	IT	103	1400

Delete a row from the DEPARTMENTS table.

DEPARTMENT_ID	DEPARTMENT_NAME	MANAGER_ID	LOCATION_ID
10	Administration	200	1700
20	Marketing	201	1800
30	Purchasing		
50	Shipping	124	1500
60	ΙΤ	103	1400

The DELETE Statement

☐ You can remove existing rows from a table by using the DELETE statement.

```
DELETE [FROM] table
[WHERE condition];
```

Deleting Rows from a Table

☐ Specific rows are deleted if you specify the WHERE clause.

```
DELETE FROM departments
WHERE department_name = 'Finance';
1 row deleted.
```

■ All rows in the table are deleted if you omit the WHERE clause.

```
DELETE FROM copy_emp;
22 rows deleted.
```

Deleting Rows Based on Another Table

Use subqueries in DELETE statements to remove rows from a table based on values from another table.

Deleting Rows: Integrity Constraint Error

You cannot delete a row that contains a primary key that is used as a foreign key in another table.

```
DELETE FROM departments
WHERE department_id = 60;
```

```
DELETE FROM departments

*

ERROR at line 1:

ORA-02292: integrity constraint (HR.EMP_DEPT_FK)

violated - child record found
```

Overview of the Explicit Default Feature

- With the explicit default feature, you can use the DEFAULT keyword as a column value where the column default is desired.
- The addition of this feature is for compliance with the SQL: 1999 Standard.
- ☐ This allows the user to control where and when the default value should be applied to data.
- Explicit defaults can be used in INSERT and UPDATE statements.

Using Explicit Default Values

DEFAULT with INSERT:

```
INSERT INTO departments
   (department_id, department_name, manager_id)
VALUES (300, 'Engineering', DEFAULT);
```

DEFAULT with UPDATE:

```
UPDATE departments
SET manager_id = DEFAULT WHERE department_id = 10;
```

☐ If no default value for the corresponding column has been specified, Postgres sets the column to null.

The MERGE Statement

- Provides the ability to conditionally update or insert data into a database table
- Performs an UPDATE if the row exists, and an INSERT if it is a new row:
 - Avoids separate updates
 - Increases performance and ease of use
 - Is useful in data warehousing applications: you may need to work with data coming from multiple sources, some of which may be duplicates. With the MERGE statement, you can conditionally add or modify rows.
- The MERGE statement is deterministic. You cannot update the same row of the target table multiple times in the same MERGE statement.

The MERGE Statement Syntax

☐ You can conditionally insert or update rows in a table by using the MERGE statement.

```
MERGE INTO table_name table_alias
  USING (table|view|sub_query) alias
  ON (join condition)
  WHEN MATCHED THEN
     UPDATE SET
     col1 = col_vall,
     col2 = col2_val
  WHEN NOT MATCHED THEN
     INSERT (column_list)
     VALUES (column_values);
```

Merging Rows

- ☐ Insert or update rows in the COPY EMP table to match the EMPLOYEES table.
 - The example shown matches the EMPLOYEE ID in the COPY EMP table to the EMPLOYEE ID in the EMPLOYEES table. If a match is found, the row in the COPY EMP table is updated to match the row in the EMPLOYEES table. If the row is not found, it is inserted into the COPY EMP table.

```
MERGE INTO copy_emp
 USING employees e
 ON (c.employee id = e.employee id)
WHEN MATCHED THEN
 UPDATE SET
    c.first name = e.first name,
    c.last name
                     = e.last name,
    c.department id = e.department id
WHEN NOT MATCHED THEN
 INSERT VALUES (e.employee id, e.first_name, e.last_name,
          e.email, e.phone number, e.hire date, e.job id,
          e.salary, e.commission pct, e.manager id,
          e.department id);
```

Merging Rows

- The condition c.employee_id = e.employee_id is evaluated. Because the COPY_EMP table is empty, the condition returns false: there are no matches. The logic falls into the WHEN NOT MATCHED clause, and the MERGE command inserts the rows of the EMPLOYEES table into the COPY EMP table.
- If rows existed in the COPY_EMP table and employee IDs matched in both tables (the COPY_EMP and EMPLOYEES tables), the existing rows in the COPY_EMP table would be updated to match the EMPLOYEES table.

```
SELECT *
FROM COPY EMP;
no rows selected
MERGE INTO copy emp c
  USING employees e
  ON (c.employee id = e.employee id)
WHEN MATCHED THEN
  UPDATE SET
WHEN NOT MATCHED THEN
 INSERT VALUES ...;
SELECT *
FROM COPY EMP;
20 rows selected.
```

Summary

Statement	Description
INSERT	Adds a new row to the table
UPDATE	Modifies existing rows in the table
DELETE	Removes existing rows from the table
MERGE	Conditionally inserts or updates data in a table
